The starter code contains 3 Java packages (folders) named *common*, *original*, and *proj1*. You want to get all three packages (with those names) into a new project. You also want to make sure the JUnit4 Library is part of the project.

IntelliJ IDE

Create a new project. In the left-hand pane, your project folder will contain a folder named *src* (for source). Click and drag the three Java packages from the window where you unzipped them to the src folder in IntelliJ. If it gives you problems, find where the src folder is on your hard drive or flash drive and copy the Java packages into it that way. They should appear in IntelliJ once copied. Consult the "Tips for using IntelliJ" document on our Nexus page for how to add JUnit to your project.
